Hacking for Defense™ (H4D) is the most unique and rewarding class you’ll take at George Washington University. A course designed for all graduate students in all schools and programs, it takes an entrepreneurial, interdisciplinary approach to solve America’s hardest national security challenges.

The complexity of these challenges demands a transformative effort that requires multi-faceted teams comprised of graduate students from the schools of business, engineering, international affairs, law, medicine, and everywhere else. We need and want entrepreneurs, policy professionals, makers, and mechanical engineers, systems engineers, computer scientists, biomedical and public health professionals, physicists, scientists, ethicists, and everyone between to be part of this unique effort.

H4D is a modern renaissance class – it covers policy, economics, technology, great power competition, national security, and whatever else you need to learn to solve your problem sponsor’s pain points. You will be at the forefront of changing the paradigm of solution development for the U.S. Government and the private sector.

The course is demanding; you’ll conduct 100+ interviews; you’ll present at every class; you’ll work closely with your team; you’ll receive relentlessly direct feedback; and your problem sponsors, mentors, military liaisons, corporate partners, investors, and journalists may be in the room. But, you’ll be solving real problems for real customers, in real-time – and we are live-streaming the whole thing every week on Twitter.

Welcome to the revolution - it’s why you came to GWU. You can take one more theory class or you can change the world. Your choice.
